

3. *“The most elegant system of the Sun, planets, and comets could not have arisen without the design and dominion of and intelligent and powerful being.” Isaac Newton*

In this time, it's known plenty of facts about universe we live in. There are galaxies, planets, stars, etc. Somehow, planet Earth ended up in perfect position to be suitable for developing life on it. It's enough close to the Sun to receive heat and light, but not too close to be burned up. Also, it has atmosphere, plants which give us breathable oxygen, clean and drinkable water, and humans who have ability to create life. But there is one question we all wonder: how and where did all of that come from?

There are two most familiar answers to this question: the Big Bang theory and the theory of God. By the scientist point of view, there was one multi-particle which had huge amount of energy and because of it's speed, movement, and energy this particle exploded into millions of pieces spreading through time and space, so it created universe as we know it. Those particles were consisted of strings vibrating at different frequencies creating different types of matter. Because of that, we have various materials, planets, etc. By that, our universe is nothing but accidental combinations of those same-frequency vibrating strings and somehow everything ended up being perfectly disposed to creating conditions in which we can live. When you look at the numbers and mathematical calculations, you can see there are about 20 very important constants which describe our universe and changing even one of them for just a little bit would give totally new universe. In that case, we need to ask ourselves (and scientist) how it's all of that, those 20 constants, Earth's positions in Solar system, biological systems and its productions, perfectly harmonized in order for life to exist like it does? Science can't explain this to the end perfectly, and that is where religion make it's own way. If we look at life at planet Earth like it's supposed to be there for some higher purpose, we would need intelligent life behind the scene. Because the God is considered for *the creator*, he fits in this role of intelligent and powerful being who made everything perfectly arranged. There is story that he created world and us for just 6 days and many people believe in this story, even though we have clear evidences for evolution all around us. We have fossils, DNA mutations, presence and absence of *palmaris longus* on our hands, etc. Someone would say that the work of God is seen through miracles like cured cancer, or people who start walking again after bad crush accident. But isn't it just human nature to regenerate cells, power of will, making your body work for you not against you? When you look it like this, you start thinking the God doesn't exist because you can't see his actual work of art. But still, we have Bible, we have evidences that there was someone named Jesus and that he walked this Earth, making things no ordinary man could. So it's reasonable for some people to think that He made universe and planets the way they are now, in order for us to exist.

At the end of the day, there is some kind of a battle between science and religion. Science is full of evidences against religion, but it still doesn't answer to all of our questions. If we want to believe that we are more that coincidental product of the evolution and universe, we would try finding answers and truth in religion and for us, God would be that intelligent and powerful being who made everything possible, who put the Earth in perfect place to be full of life. It's on us to choose who wins: science, in which most of the things are product of coincidence and so are we, or religion in which all of this is the God's work of art?
